                                                                                                                     DNA Sequencing: DOB Joint Genome Institute: http://www.jgi.doe.gov
Clone Distribution: I.M.A.G.B. Consortium/LLNL:
http://image.llnl.gov
Naming Conventions: EST name is generated by the concatenation of
the JGI Clone Id and the direction of sequencing. The suffix '.fwd'
indicates a forward sequencing read of the insert. It does not
necessarily reflect the orientation of the insert.

Tissue Procurement: Richard M. Harland Laboratory, University of

California, Berkeley: http://tropicalis.berkeley.edu/home

cDNA Library Preparation: Richard M. Harland Laboratory, University

of California, Berkeley

DNA Sequencing: DOE Joint Genome Institute: http://www.jgi.doe.gov

Clone Distribution: I.M.A.G.B. Consortium/LLNL:

http://image.llnl.gov

Naming Conventions: EST name is generated by the concatenation of
the JGI Clone Id and the direction of sequencing. The suffix '.fwd'
indicates a forward sequencing read of the insert. It does not
necessarily reflect the orientation of the insert.

Plate: XZT 0653 row: b column: 9

High quality sequence stop: 828.

Stratagene

```
Naming Conventions: EST name is generated by the concatenation of the JGI Clone Id and the direction of sequencing. The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert. Plate: XZTJ SB5 row: m column: 2
High quality sequence stop: 829.

The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert. Plate: XZG 0685 row: 1 column: 3
High quality sequence stop: 827.

The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert.

The suffix '.fwd' indicates a forward sequencing read of the insert. It does not necessarily reflect the orientation of the insert.

                                                                                                                                                                                                                                                                                                                                                                                                                                       Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Stratascript reverse transcriptase. After ligation of EcoRI adapters (5'-AATTCGGCACGAGG-3') followed by kinasing adapters and by KhoI digestion, the cDNA was size selected by chromatography on Sepharose CL-2B columns and fractions containing cDNAs larger than 1000 bp were ligated into EcoRI/KhoI-digested pGS107. Tissue Procurement: Richard M. Harland Laboratory, University of

California, Berkeley: http://tropicalis.berkeley.edu/home

CDNA Library Preparation: Richard M. Harland Laboratory, University

of California, Berkeley

DNA Sequencing: DOE Joint Genome Institute: http://www.jgi.doe.gov

Clone Distribution: I.M.A.G.E. Consortium/LLNL:

http://image.llnl.gov

Naming Conventions: EST name is generated by the concatenation of
the JGI Clone Id and the direction of sequencing. The suffix '.fwd'
indicates a forward sequencing read of the insert. It does not
necessarily reflect the orientation of the insert.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CO Oligonucleotide which will hybridise under selected comprising an CC Papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed Ct target region. Oligonucleotides are useful to detect HPV Type 16 and/or CC IS in samples e.g. cervical smears, body fluid, and distinguish these CC from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and 18 are associated with genital cancers. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target CC duplex formation; target nucleic acid in a sample. HPV Type 16 or CC duplex formation; target nucleic acid in a sample. HPV Type 16 or CC 18 can be specifically detected by amplifying nucleic acids with at least CC noe specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonucleotides can distinguish target sequences from CC phylogenetically close HPV Types 16 and 18 whilst available detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AATO3307-08 and T3309 are a pair of primers and a probe respectively, for the amplification and detection of a human papilloma virus E6 gene restriction fragment. They are used to exemplify a new method for conducting nucleic acid amplification reactions in the presence of an ionic detergent such as SDS or LLS. The method can be used for enhancing the activity of enzymes such as DNA-directed DNA polymerase, RNA-directed DNA polymerase, DNA-directed DNA polymerase, DNA-directed DNA polymerase, and enzyme, restriction endonucleases or proteases. (Updated on 27-AUG-2003 to correct OS field.)

CC amplify HPV Type 16 and 18 are assoc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SXS
                                                                                                                                                                                                                                                                                Novel hybridisation assay probes have been developed comprising an CC oligonuclectide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed CC target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV CTypes 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 cand/or 18 can be detected by adding a probe and detecting probe:target CC duplex formation; target nucleic acid is optionally amplified. Type 16 or CC 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonuclectides can distinguish target sequences from CC phylogenetically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonuclectides can distinguish target sequences from CC phylogenetically claimed PCR primer is and 18 whilst available detection CC sera react with antigens of all papillomaviruses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC Novel hybridisation assay probes have been developed comprising an CC oligonucleotide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed CC target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these CC from other HPV variants. Papillomaviruses are small DNA viruses and HPV CT Types 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target CC duplex formation; target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonucleotides can distinguish target sequences from CC phylogenetically close HPV Types 16 and 18 whilst available detection CC sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel hybridisation assay probes have been developed comprising an coligonuclectide which will hybridise under selected conditions to Human coligonuclectide (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 35, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed target region. Oligonucleotides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and 18 are associated with genital cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target duplex formation, target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel immortalized endometrial glandular epithelial cell strain in which an exogenous immortalizing gene is introduced and the properties of the cell line as non-cancer typical glandular epithelial cells, are maintained. The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. The cell line maintains the properties of normal somatic cells and the properties of endometrial glandular epithelial cells. The current sequence is that of the Human papillomavirus type 16 E6 delta151 mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     misc_difference 3. .4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response in a patient to a target protein or its fragment. The method involves introducing a vector containing a nucleotide sequence encoding a chimeric immunogen comprising a protein processing signal and the target protein or its fragment. The immunogen is produced by the cells and processed so that the target protein or its fragment is presented to the patients immune system and cellular immune response is initiated. The method and vectors can be used as a form of vaccination and could be used to generate a cellular immune response in patients to, e.g. cancerous tumours. The cellular immune response is the predominant immune response in the patient. This sequence represents a DNA fragment which encodes a tumour antigen from human papillomavirus E6 described in the method of the invention. Note: The information in this spec has been previously
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Generating cellular immune response in patient to target protein - comprises introducing vector with nucleotide sequence encoding immunogen comprising protein processing signal into cell of patient.

Producing an immortalized non-tumorigenic human Schwann or schwannoma cell line for treating cancer or neurodegenerative disorder comprises selecting for immortalized cells that express the exogenous immortalizing
```

Disclosure; SEQ ID NO 1; 29pp; English

CC screening carcinogenicity of an agent; acreening the neuroprotective cartivity of an agent; treating neurodegeneration in a patient; and a kit cfor screening a pharmacological agent on schwannomas cells. In the method of producing an immortalised non-tumourigenic human Schwann or schwannoma cell line, the polynucleotide is a subgenomic fragment of a virus consisting of SV40 (Simian Virus 40), adenovirus and human papilloma consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised constitution of schwann or schwannoma cell line has cytostatic and constitution of the man schwann or schwannoma cell line has cytostatic and concurrigenic human Schwann or schwannoma cell line has cytostatic and concurring the method is useful for producing an immortalised non-tumourigenic human schwann or schwannoma cell line useful for screening cancer chemotherapeutic and antineoplastic activity of an agent, testing carcinogenicity of an agent and screening a neuroprotective activity of an agent and screening and activity of an agent and screening and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activity of an agent and activi The invention relates to a the production of an immortalised non-tumourigenic human Schwann or schwannoma cell line comprising: providing a cell culture of human Schwann or schwannoma cells, introducing a polynucleotide comprising an exogenous immortalising gene into the cells, and selecting for immortalised cells that express the exogenous an agent and for preparing a composition for diagnosing or treating neurodegenerative disorders and cancer. This polymucleotide represents the DNA of a 455b HPVI6 sequence, a subgenomic fragment used in the production of the immortalised non-tumourigenic human Schwann or of a pharmacological agent on human Schwann or schwannoma cells schwannoma cell line of immortalising gene and retain phenotypic properties of Schwann or schwannoma cells. The invention further comprises: determining the effect the invention.

A complex of the invention has virucide and cytostatic activity, and may have a use as vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered points for the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09584-ADF09697 represent cDNA's of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing a condition involving altered level of the complex e.g. human papilloma virus infection, or cancer.
Selective post-transcriptional silencing of an exogenous viral gene (e.g. human papilloma virus (HPV) E6), for treating e.g. cancer, comprises using a small interfering RNA (siRNA) construct homologous to an mRNA of
                                                                                                                                                                                                                                                                                                                                                                            17-JUL-2001; 2001GB-00017358.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FX8X5555555555555555555555555
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for selective post-translational silencing in a mammalian cell of the expression of an exogenous gene of viral origin. The method comprises introducing into the cell a small cinterfering RNA (siRNA) construct that is homologous to a part of the mRNA sequence of the gene. The method is useful for the selective post-transcriptional silencing of an exogenous gene of viral origin (e.g. an oncogene or human papilloma virus (HPV) gene) in a mammalian cell. The method or the siRNA is particularly useful for treating cancer, human cell carring cancer, human codeficiency virus (HIV), smallpox, flu, or a disease caused by a HPV (e.g. genital warts, cervical cancer, penile cancer, malignant squamous cell carcinomas or verruca vulgaris). An siRNA construct or vector is useful for use as a medicament for the diseases mentioned. The polynucleotide sequence of the invention can be used to treat disorders by gene therapy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
Best Local S
                               epithelial cell strain in which an exogenous immortalizing gene is introduced and the properties of the cell line as non-cancer typical glandular epithelial cells, are maintained. The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. The cell line mich is otherwise mon-cancerous, and analyzing the effect of carcinogenic substances on the cell line.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             silencing in a mammalian cell of the expression of an exogenous gene of viral origin. The method comprises introducing into the cell a small interfering RNA (siRNA) construct that is homologous to a part of the mRNA sequence of the gene. The method is useful for the selective post-transcriptional silencing of an exogenous gene of viral origin (e.g. an oncogene or human papilloma virus (HPV) gene) in a mammalian cell. The method or the siRNA is particularly useful for treating cancer, human cervical cancer, human immunodeficiency virus (HTV), smallpox, flu, common cold, or a disease caused by a HPV (e.g. genital warts, cervical cancer, penile cancer, malignant squamous cell carcinomas or vertuca vulgaris). An siRNA construct or vector is useful for use as a medicament for the diseases mentioned. The polynucleotide sequence of the invention can be used to treat disorders by gene therapy. This polynucleotide sequence represents the DNA of a HPV siRNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immortalized endometrial glandular epithelial cell strain containing exogenous immortalizing gene and maintains properties of non-cancer and typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelial cells, useful in field of research or typical glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular epithelia glandular e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel immortalized endometrial glandular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 4; SEQ ID NO 3; 22pp; Japanese.

The invention is useful for the treatment of cancer, tumor, carcinoma of cutaneous, squamous or cervical epithelia and colorectal carcinoma, wounds, burns and scars. The invention is also useful in gene therapy. The present sequence is the human papillomavirus type 16 E6/E7 gene fragment. This sequence is useful in a method for

The variant is preferably a deletion mutant comprising at least half, and preferably two rthirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunogenicity of, the fusion protein. This sequence encodes a fusion between the C-terminal end of E6 and the N-terminal end of E7. The protein is also a deletion mutant generated from the sequence describe in AAT31833. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human papillomavirus E6/E7 fusion gene, its preparing process, the process for configuring the efficient expression carrier containing the gene and resultant expression carrier, the fusion protein prepared from the gene, and the application of the fusion gene and expression protein to medical science and medicine to treat cervix cancer are disclosed. The present sequence represents the human papillomavirus fusion gene encoding sequence.

                                               The patent is for a rapid in situ hybridisation assay for detecting and typing human papilloma virus (HPV) in non-frozen cellular smears fixed to a support in absence of aldehyde-based crosslinking reagents. The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences of the E6 and E7 polypeptide-encoding regions of human papillomavirus (HPV) 16 and 18 are given in AAQ75470-71 and the encoded proteins in AAR63865-66, respectively. Probes and primers based on these sequences were used for HPV infection diagnosis, expression of E6 and E7 is diagnostic for cervical cancer or pre- malignant states.                                                                                                                       The present sequence encodes an E7E6 fusion protein, comprising wild type E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 3 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for treating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

                                                     The present sequence encodes a fusion protein, comprising E6 and E7

polypeptides from human papillomavirus type 16 (HPV16). The fusion

protein is designated E6E7PentM, and comprises an E6 amino terminus

(where residues 63 and 106 have been replaced with glycine) and an E7

carboxy terminus (where residues 24, 26 and 91 have been replaced with
glycine). E6E7PentM is representative of fusion proteins of the

cinvention. The specification describes human papillomavirus E6 and E7

polypeptides, where the E7 polypeptide has mutations at any one or more

of the amino acids corresponding to amino acids 24, 26 or 91 of the

sequence given in AD044073 and the E6 polypeptide has no mutations or has

mutations at any one or more of the amino acids corresponding to amino

acids 63 or 106 of there sequence given in AD044072. The polypeptides of

the invention are useful for treating or preventing human papillomavirus

(HPV)-associated cancers, such as cervical cancer. The fusion proteins

and nucleic acids encoding the fusion proteins are useful for generating

immune responses sgainst HPV. They are also useful for treating lower

cyastrointestinal tract cancers, e.g. anal cancer, and other cancers of

the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer;

                                                                                                                                                  The present sequence encodes an E6E7 fusion protein, comprising wild type E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Smith L,

                                                  á
                                                                                                                                                                                                                                                                                                                       The present sequence encodes a fusion protein, comprising E6 and E7 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E6E7TetM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy CC terminus (where residues 24 and 26 have been replaced with glycine). CE E6E7TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in CC AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating lumnum responses against HPV. They are also useful for treating lower gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.
                                                                                                                                    Best Loc

                                                                                                                          The present sequence encodes a fusion protein, comprising E7 and E6 CC polypeptides from human papillomavirus type 16 (HgV16). The fusion CC protein is designated E7E6TetM, and comprises an E7 amino terminus (where CC residues 24 and 26 have been replaced with glycine) and an E6 carboxy CC E7E6TetM is representative of fusion proteins of the invention. The specification describes human appillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in CC AD044073 and the E6 polypeptide has no mutations or has mutations at any CC one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated CC cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids capainst HPV. They are also useful for treating lower gastrothtestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive concerns, including penile and vulvar cancer.

                                                                                                   The present sequence encodes a fusion protein, comprising E7 and E6 copypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E758FentM, and comprises an E7 amino terminus (where residues 24, 26 and 91 have been replaced with glycine) and an E6 coarboxy terminus (where residues 63 and 106 have been replaced with glycine) and E7 cycline). E7E6FentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)—associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for treating lower immune responses against HPV. They are also useful for treating lower the support of the cancers of the arrorductive system including realise and vulvar cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

                                         CC sequence for prew protein of dengue virus and also includes elements of ce.g. the non-coding region in the whole of the 5-end, the coding region of the front 20 amino acids in the C protein, and the coding region of co of the front 20 amino acids in the C protein, and the coding region of co obtained vaccines are useful in producing preventives or/and remedies for concer like cervical cancer and viral diseases. Such vaccines can cefficiently express antigen in infected cells, which is because dengue co virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to crepatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. CC thuman papillomavirus (HPV) vaccines were prepared by using a genecupressing system using of the full-length dengue virus cDNA clone (pRK/FLD2). The recombinant virus vectors were transfected into baby can first sequence corresponds to the HPV type 16 E7 gene used as the contains of interest in the recombinant vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                 Virus-like particle vaccines containing dengue virus recombinant replicon as core for carrier, applicable in preventives or/and remedies for tumors like cervical cancer and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human

                                                                      Query Match
                                                                                                                  The present invention provides a virus-like particle (VLP) vaccine which contains dengue virus (DEN) recombinant replicon as its core. The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncogene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               paraformaldehyde; treating the cells with a protease to permeabilise them without altering morphology; adding amplification reagents; incubating the cells at below fifty degrees celsius to perform amplification by self sustained sequence replication; adding a labelled probe complementary to the region between the primers; washing cells to remove unhybridised probe and then detecting the labelled probe. The E6/E7 region of human papilloma virus (HPV) I6 is used especially to detect mRNA being transcribed from this region which becomes active in transformed cells. The method can be used for the early diagnosis of cervical cancer. Primers used to amplify fragments of the E6/E7 region are described in AAT14664-T14674. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                            This nucleotide probe is specific for the HPV16 Human Papilloma Virus (HPV) gene. The degree of HPV infection can be assessed, by measuring the levels of expression of genes involved in the diseased state, and comparing the expression to each other or to reference genes. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24-OCT-2003 (
25-MAR-2003 (
09-MAR-1993 (
The fragment of DNA contg. the HPV-16 E6/E7 coding region was prepd. by PCR from plasmid pBR322/HPV16 (Durst et al., PNAS, 80: 3812 (1983)) using oligonucleotides SO5 and SO6. The DNA prod. has a site for Nco1 at the beginning of the E6 gene and a Smal site immediately downstream of the termination codon for E7. The E6 and E7 ORFS are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use
